# Chapter 1

## LemonDB

### Introduction

A simple multi-thread key-value database by Lemonion. Inc.

See more information in our official documentation [HTML/PDF](#)

### Compilation

#### Debug

This version is used for debugging.

```
mkdir debug && cd debug
cmake .. -DCMAKE_BUILD_TYPE=Debug
make lemondb
src/lemondb
```

#### Release

This version is used for performance test.

```
mkdir release && cd release
cmake .. -DCMAKE_BUILD_TYPE=Release
make lemondb
src/lemondb
```

### Testing

For a small test case, just use the files under `test` folder. Set the working directory as `test`, set the program argument as `test.query` or `test*.in`.

The test cases are too bug, so they are stored with Git LFS. See more information on [Git LFS pages](#).

Once Git LFS extension is installed, you can download the test cases through cloning the submodule:

```
git submodule init
git submodule update
```

Set the working directory as `testcase/sample`, set the program argument as `*.query`, simply start debugging! (The loading query in all test files should be based on `testcase/sample` directory)

## Documentation

The working flow of LemonDB is written by ourselves.

The class / function documentation is generated by [Doxygen](#).

## Design

- We design this program to make it can create 8 threads. We classify the queries using table and add them into queryqueue of corresponding table when we read them from the file. Once the table needed has been loaded completely, we will execute the queries as the order in queue and read query if the file hasn't ended at the same time.
- Queries in the queryqueue will be run in the parallel.
- Even in one query, for data queries that need searching and calculation such as SUB or SUM in a large table, we use a function `addIterationTask` to divide the table into several parts and search or calculate these parts simultaneously. Because the efficiency depends on the ratio between size of every part and size of the table, we did experiments and then find 10000 is a good size. For queries like TRUNCATE and INSERT, since they don't have to traverse the whole table, we don't add task for them.
- The query class will use a "combine" function to check whether all the tasks dispatched by one query are all finished and organize them in the order and show on the screen.
- When the user ask for quit, the quit query will check whether all tasks have already finished and and exit the program.

## Performance Improvement

We use many tricks to improve performance:

- Since we use a vector to store all data in a table, we obtain the advantage of efficient random access. Meanwhile, deleting and inserting datum becomes less efficient inevitably. However, we use some tricks to handle this issue. Notice that the vector is unordered, so for INSERT query it can be trivially appended to the vector with  $O(1)$ . Then for DELETE and DUPLICATE query, we use a temporary vector `dataNew`. When iterating through data, those won't be deleted will be moved to `dataNew` by `std::move`, which is extremely fast. Then we simply swap `data` and `dataNew`, clear `dataNew` for further use. For DUPLICATE, things are slightly different. We insert duplicated data into `dataNew`, and then we append `dataNew` to `data`. These iteration can be executed in parallel, so `dataNew` is, of course, protected by a mutex.
- Another great improvement is for those query with a condition 'KEY = someKey'. Making use of efficient random access, we keep a `keyMap` which stores index for given key. With this map, we can complete those query very efficiently, without iterating through data.
- For those query without given key, we also improve the speed of evaluating condition. This is done by computing the condition explicitly for a specific query (by `std::function`), and simply pass this function to it. By doing so, we don't need to repeatedly compare string, convert string to integer, even switch among operators. This can save huge amount of time, because originally every datum use one general evaluating function. Now we just need to compute it once per query.
- In some trivial cases `atomic_int` is used instead of having a mutex because it is much faster.

## Problems Solved

Due to our sophisticated design, we ran into many problems. These are some of them:

- We have encountered many problems about the query queue. The problem of LOAD query is the most difficult one, because it doesn't specify a table name. In our design, every table has a query queue so that we can decide the order to execute them, following reader/writer pattern. But LOAD doesn't have it, so it's very difficult to decide where to put it, because the file may even not exist when the query is parsed and put into some queue. DUMP query is the reason we concern about this issue, so we solve it by keeping a map from filename to tablename. With this map, LOAD can decide whether the file is (or will be) created by DUMP or should exist already.
- Another issue is COPYTABLE. This is the other query which can create a table, in which case it is responsible for starting the query queue to execute. And the problem is that COPYTABLE involves 2 table, so it should be pushed to both tables. And only when both query queues come to this query should it execute. This is done by keeping each other's pointer in it.
- Other problems such as mutex or deadlock are less encountered, because we consider carefully about implementation before we start to code.

## Chapter 2

# Hierarchical Index

### 2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

Database	19
invalid_argument	
ConflictingKey	16
DuplicatedTableName	25
IllFormedQuery	29
IllFormedQueryCondition	29
MultipleKey	38
QueryBuilderMatchFailed	43
TableNameNotFound	61
Table::IteratorImpl< ObjType, DatumIterator >	31
Table::IteratorImpl< Object, decltype(data.begin())>	31
Table::ObjectImpl< Iterator, VType >	39
out_of_range	
TableFieldNotFound	61
Query	41
ListTableQuery	32
NopQuery	38
PrintTableQuery	40
TaskQuery	64
ComplexQuery	12
AddQuery	9
CountQuery	18
DeleteQuery	21
DuplicateQuery	25
InsertQuery	30
MaxQuery	34
MinQuery	36
SelectQuery	46
SubQuery	48
SumQuery	51
SwapQuery	53
UpdateQuery	68

## Chapter 4

# Class Documentation

### 4.1 AddQuery Class Reference

Inheritance diagram for AddQuery:

#### Public Member Functions

- **LEMONDB\_QUERY\_WRITER** (true)
- `QueryResult::Ptr` **execute** () override
- `std::string` **toString** () override
- `QueryResult::Ptr` **combine** (int [taskComplete](#)) override

#### Protected Member Functions

- **LEMONDB\_TASK\_PTR\_DEF** ([AddTask](#))

#### Friends

- class **AddTask**

## Additional Inherited Members

### 4.1.1 Detailed Description

Definition at line 9 of file `add_query.h`.

The documentation for this class was generated from the following files:

- `src/query/data/add_query.h`
- `src/query/data/add_query.cpp`

## 4.2 AddTask Class Reference

Inheritance diagram for AddTask:

### Public Member Functions

- void **execute** () override

### Protected Member Functions

- **LEMONDB\_QUERY\_PTR** ([AddQuery](#))

### Friends

- class **AddQuery**

## Additional Inherited Members

### 4.2.1 Detailed Description

Definition at line 23 of file `add_query.h`.

The documentation for this class was generated from the following files:

- `src/query/data/add_query.h`
- `src/query/data/add_query.cpp`

## 4.3 AnswerResult Class Reference

Inheritance diagram for AnswerResult:

### Public Member Functions

- **AnswerResult** (std::vector< int > &&answer)
- **AnswerResult** (int answer)
- std::string **toString** () override

### Additional Inherited Members

#### 4.3.1 Detailed Description

Definition at line 108 of file query\_results.h.

The documentation for this class was generated from the following file:

- src/query\_results.h

## 4.4 BasicQueryBuilder Class Reference

Inheritance diagram for BasicQueryBuilder:

### Public Member Functions

- void **setNext** (Ptr &&builder) override
- Query::Ptr **tryExtractQuery** ([TokenizedQueryString](#) &query) override
- void **clear** () override

## Protected Attributes

- QueryBuilder::Ptr **nextBuilder**

## Additional Inherited Members

### 4.4.1 Detailed Description

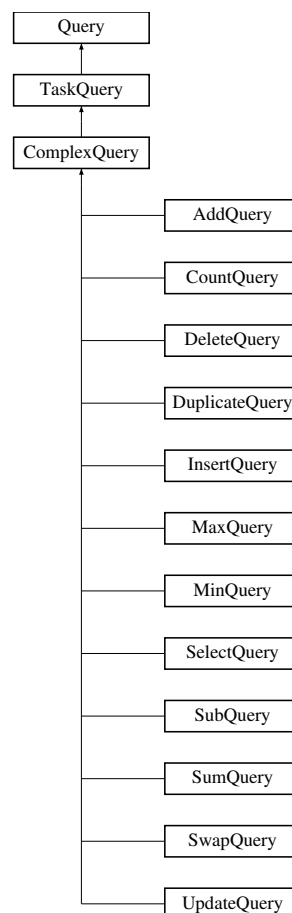

Definition at line 41 of file query\_builders.h.

The documentation for this class was generated from the following file:

- src/query\_builders.h

## 4.5 ComplexQuery Class Reference

Inheritance diagram for ComplexQuery:

## Public Types

- typedef std::unique\_ptr< [ComplexQuery](#) > **Ptr**

## Public Member Functions

- `std::pair< std::string, bool >` `initCondition` (const `Table` &table)
- `bool` `evalCondition` (const `Table::Object` &object)
- `bool` `testKeyCondition` (`Table` &table, `std::function< void(bool, Table::Object::Ptr &&)>` function)
- `ComplexQuery` (`std::string` targetTable, `std::vector< std::string >` `operands`, `std::vector< QueryCondition >` `condition`)
- `const std::vector< std::string >` & `getOperands` () const
- `const std::vector< QueryCondition >` & `getCondition` ()

## Protected Attributes

- `std::vector< std::string >` `operands`
- `std::vector< QueryCondition >` `condition`

### 4.5.1 Detailed Description

Definition at line 100 of file query.h.

### 4.5.2 Member Function Documentation

#### 4.5.2.1 evalCondition()

```
bool ComplexQuery::evalCondition (
    const Table::Object & object )
```

skip the evaluation of KEY (which should be done after `initConditionFast` is called)

#### Parameters

<i>conditions</i>	
<i>object</i>	

#### Returns

Definition at line 101 of file query.cpp.

#### 4.5.2.2 getCondition()

```
const std::vector<QueryCondition>& ComplexQuery::getCondition ( ) [inline]
```

Get condition in the query, seems no use now

Definition at line 150 of file query.h.

#### 4.5.2.3 getOperands()

```
const std::vector<std::string>& ComplexQuery::getOperands ( ) const [inline]
```

Get operands in the query

Definition at line 147 of file query.h.

#### 4.5.2.4 initCondition()

```
std::pair< std::string, bool > ComplexQuery::initCondition (
    const Table & table )
```

init a fast condition according to the table note that the condition is only effective if the table fields are not changed

##### Parameters

<i>table</i>	
<i>conditions</i>	

##### Returns

a pair of the key and a flag if flag is false, the condition is always false in this situation, the condition may not be fully initialized to save time

Definition at line 45 of file query.cpp.

#### 4.5.2.5 testKeyCondition()

```
bool ComplexQuery::testKeyCondition (
    Table & table,
    std::function< void(bool, Table::Object::Ptr &&)> function )
```

This function seems have small effect and causes somme bugs so it is not used actually

##### Parameters

<i>table</i>	
<i>function</i>	

##### Returns

Definition at line 113 of file query.cpp.

### 4.5.3 Member Data Documentation

#### 4.5.3.1 condition

```
std::vector<QueryCondition> ComplexQuery::condition [protected]
```

The function used in where clause

Definition at line 105 of file query.h.

#### 4.5.3.2 operands

```
std::vector<std::string> ComplexQuery::operands [protected]
```

The field names in the first ()

Definition at line 103 of file query.h.

The documentation for this class was generated from the following files:

- src/query/query.h
- src/query/query.cpp

## 4.6 ComplexQueryBuilder Class Reference

Inheritance diagram for ComplexQueryBuilder:

### Public Member Functions

- void **clear** () override
- Query::Ptr **tryExtractQuery** ([TokenizedQueryString](#) &query) override

### Protected Member Functions

- virtual void **parseToken** ([TokenizedQueryString](#) &query)

## Protected Attributes

- `std::string` **targetTable**
- `std::vector< std::string >` **operandToken**
- `std::vector< QueryCondition >` **conditionToken**

## Additional Inherited Members

### 4.6.1 Detailed Description

Definition at line 60 of file `query_builders.h`.

The documentation for this class was generated from the following files:

- `src/query_builders.h`
- `src/query_builders.cpp`

## 4.7 `ConflictingKey` Struct Reference

Inheritance diagram for `ConflictingKey`:

## Public Member Functions

- **`ConflictingKey`** (`const std::string &str`)

### 4.7.1 Detailed Description

Definition at line 26 of file `uexception.h`.

The documentation for this struct was generated from the following file:

- `src/uexception.h`

## 4.8 `CopyTableDestQuery` Class Reference

Inheritance diagram for `CopyTableDestQuery`:

## Public Member Functions

- **LEMONDB\_QUERY\_WRITER** (true)
- **LEMONDB\_QUERY\_INSTANT** (true)
- **CopyTableDestQuery** (std::string table, [CopyTableQuery](#) \*srcQuery)
- QueryResult::Ptr **execute** () override
- std::string **toString** () override

## Friends

- class **CopyTableQuery**

## Additional Inherited Members

### 4.8.1 Detailed Description

Definition at line 26 of file copy\_table\_query.h.

The documentation for this class was generated from the following files:

- src/query/management/copy\_table\_query.h
- src/query/management/copy\_table\_query.cpp

## 4.9 CopyTableQuery Class Reference

Inheritance diagram for CopyTableQuery:

## Public Member Functions

- **LEMONDB\_QUERY\_WRITER** (false)
- **CopyTableQuery** (std::string table, std::string newTable)
- QueryResult::Ptr **execute** () override
- std::string **toString** () override
- Query::Ptr **createDestQuery** ()

## Additional Inherited Members

### 4.9.1 Detailed Description

Definition at line 13 of file `copy_table_query.h`.

The documentation for this class was generated from the following files:

- `src/query/management/copy_table_query.h`
- `src/query/management/copy_table_query.cpp`

## 4.10 CountQuery Class Reference

Inheritance diagram for CountQuery:

### Public Member Functions

- **LEMONDB\_QUERY\_WRITER** (false)
- `QueryResult::Ptr execute ()` override
- `std::string toString ()` override
- `QueryResult::Ptr combine (int taskComplete)` override

## Additional Inherited Members

### 4.10.1 Detailed Description

Definition at line 7 of file `count_query.h`.

The documentation for this class was generated from the following files:

- `src/query/data/count_query.h`
- `src/query/data/count_query.cpp`

## 4.11 CountTask Class Reference

Inheritance diagram for CountTask:

### Public Member Functions

- void **execute** () override

### Protected Member Functions

- **LEMONDB\_QUERY\_PTR** ([CountQuery](#))

### Additional Inherited Members

#### 4.11.1 Detailed Description

Definition at line 17 of file count\_query.h.

The documentation for this class was generated from the following files:

- src/query/data/count\_query.h
- src/query/data/count\_query.cpp

## 4.12 Database Class Reference

### Public Member Functions

- void **registerTable** (Table::Ptr &&table)
- [Table](#) & **ensureTable** (const std::string &tableName)
- void **dropTable** (std::string tableName)
- void **printAllTable** ()
- [Table](#) & **operator[]** (std::string tableName)
- const [Table](#) & **operator[]** (std::string tableName) const
- [Database](#) & **operator=** (const [Database](#) &)=delete
- [Database](#) & **operator=** ([Database](#) &&)=delete
- [Database](#) (const [Database](#) &)=delete
- [Database](#) ([Database](#) &&)=delete
- void **updateFileName** (const std::string &fileName, const std::string &tableName)
- std::string **getFileName** (const std::string &fileName)
- void **addQuery** (Query::Ptr &&query)
- void **addTask** ([Task](#) \*task)
- void **addResult** ([Query](#) \*query, QueryResult::Ptr &&result)
- void **completeQuery** ()
- void **endQuery** ()
- bool **isEnd** () const
- void **joinThreads** ()

## Static Public Member Functions

- static [Database](#) & `getInstance ()`

### 4.12.1 Detailed Description

Definition at line 16 of file db.h.

### 4.12.2 Member Function Documentation

#### 4.12.2.1 addQuery()

```
void Database::addQuery (  
    Query::Ptr && query )
```

Add a parsed query after reading it dispatch the query according to its target table

#### Parameters

<i>query</i>	
--------------	--

Definition at line 117 of file db.cpp.

#### 4.12.2.2 addTask()

```
void Database::addTask (  
    Task * task )
```

Add a generated task after a query has been executed by a table idle working threads are waiting for the task

#### Parameters

<i>task</i>	
-------------	--

Definition at line 146 of file db.cpp.

#### 4.12.2.3 completeQuery()

```
void Database::completeQuery ( )
```

try to output the query result in order

Definition at line 165 of file db.cpp.

#### 4.12.2.4 ensureTable()

```
Table & Database::ensureTable (
    const std::string & tableName )
```

get the table if it already exists create a table if tableName not found use tablesMutex, call it when needed if table↔ Name must exist, use operator[]

#### Parameters

<i>tableName</i>	
------------------	--

#### Returns

Definition at line 43 of file db.cpp.

The documentation for this class was generated from the following files:

- src/db/db.h
- src/db/db.cpp

## 4.13 DeleteQuery Class Reference

Inheritance diagram for DeleteQuery:

#### Public Member Functions

- **LEMONDB\_QUERY\_WRITER** (true)
- QueryResult::Ptr **execute** () override
- std::string **toString** () override
- QueryResult::Ptr **combine** (int [taskComplete](#)) override

## Friends

- class **DeleteTask**

## Additional Inherited Members

### 4.13.1 Detailed Description

Definition at line 11 of file delete\_query.h.

The documentation for this class was generated from the following files:

- src/query/data/delete\_query.h
- src/query/data/delete\_query.cpp

## 4.14 DeleteTask Class Reference

Inheritance diagram for DeleteTask:

## Public Member Functions

- void **execute** () override

## Protected Member Functions

- **LEMONDB\_QUERY\_PTR** ([DeleteQuery](#))

## Additional Inherited Members

### 4.14.1 Detailed Description

Definition at line 22 of file delete\_query.h.

The documentation for this class was generated from the following files:

- src/query/data/delete\_query.h
- src/query/data/delete\_query.cpp

## 4.15 DropTableQuery Class Reference

Inheritance diagram for DropTableQuery:

### Public Member Functions

- QueryResult::Ptr **execute** () override
- std::string **toString** () override

### Additional Inherited Members

#### 4.15.1 Detailed Description

Definition at line 11 of file drop\_query.h.

The documentation for this class was generated from the following files:

- src/query/management/drop\_query.h
- src/query/management/drop\_query.cpp

## 4.16 DumpTableQuery Class Reference

Inheritance diagram for DumpTableQuery:

### Public Member Functions

- **DumpTableQuery** (std::string table, std::string filename)
- QueryResult::Ptr **execute** () override
- std::string **toString** () override
- QueryResult::Ptr **combine** (int [taskComplete](#)) override

## Friends

- class **DumpTableTask**

## Additional Inherited Members

### 4.16.1 Detailed Description

Definition at line 11 of file dump\_query.h.

The documentation for this class was generated from the following files:

- src/query/management/dump\_query.h
- src/query/management/dump\_query.cpp

## 4.17 DumpTableTask Class Reference

Inheritance diagram for DumpTableTask:

## Public Member Functions

- void **execute** () override

## Protected Member Functions

- **LEMONDB\_QUERY\_PTR** ([DumpTableQuery](#))

## Additional Inherited Members

### 4.17.1 Detailed Description

Definition at line 24 of file dump\_query.h.

The documentation for this class was generated from the following files:

- src/query/management/dump\_query.h
- src/query/management/dump\_query.cpp

## 4.18 DuplicatedTableName Struct Reference

Inheritance diagram for DuplicatedTableName:

### Public Member Functions

- **DuplicatedTableName** (const std::string &str)

#### 4.18.1 Detailed Description

Definition at line 16 of file uexception.h.

The documentation for this struct was generated from the following file:

- src/uexception.h

## 4.19 DuplicateQuery Class Reference

Inheritance diagram for DuplicateQuery:

### Public Member Functions

- **LEMONDB\_QUERY\_WRITER** (true)
- QueryResult::Ptr **execute** () override
- std::string **toString** () override
- QueryResult::Ptr **combine** (int [taskComplete](#)) override

### Friends

- class **DuplicateTask**

## Additional Inherited Members

### 4.19.1 Detailed Description

Definition at line 11 of file `duplicate_query.h`.

The documentation for this class was generated from the following files:

- `src/query/data/duplicate_query.h`
- `src/query/data/duplicate_query.cpp`

## 4.20 DuplicateTask Class Reference

Inheritance diagram for DuplicateTask:

### Public Member Functions

- void **execute** () override

### Protected Member Functions

- **LEMONDB\_QUERY\_PTR** ([DuplicateQuery](#))

## Additional Inherited Members

### 4.20.1 Detailed Description

Definition at line 22 of file `duplicate_query.h`.

The documentation for this class was generated from the following files:

- `src/query/data/duplicate_query.h`
- `src/query/data/duplicate_query.cpp`

## 4.21 ErrorMessage Class Reference

Inheritance diagram for ErrorMessage:

### Public Member Functions

- **ErrorMessage** (const char \*qname, const std::string &msg)
- **ErrorMessage** (const char \*qname, const char \*table, const std::string &msg)
- std::string **toString** () override

### Additional Inherited Members

#### 4.21.1 Detailed Description

Definition at line 40 of file query\_results.h.

The documentation for this class was generated from the following file:

- src/query\_results.h

## 4.22 FailedQueryBuilder Class Reference

Inheritance diagram for FailedQueryBuilder:

### Public Member Functions

- Query::Ptr **tryExtractQuery** ([TokenizedQueryString](#) &q) final
- void **setNext** (QueryBuilder::Ptr &&builder) final
- void **clear** () override

## Static Public Member Functions

- static QueryBuilder::Ptr **getDefault** ()

## Additional Inherited Members

### 4.22.1 Detailed Description

Definition at line 24 of file query\_builders.h.

The documentation for this class was generated from the following file:

- src/query\_builders.h

## 4.23 FailedQueryResult Class Reference

Inheritance diagram for FailedQueryResult:

## Public Member Functions

- bool **success** () override

## Additional Inherited Members

### 4.23.1 Detailed Description

Definition at line 22 of file query\_results.h.

The documentation for this class was generated from the following file:

- src/query\_results.h

## 4.24 IIIFormedQuery Struct Reference

Inheritance diagram for IIIFormedQuery:

### Public Member Functions

- **IIIFormedQuery** (const std::string &str)

#### 4.24.1 Detailed Description

Definition at line 46 of file uexception.h.

The documentation for this struct was generated from the following file:

- src/uexception.h

## 4.25 IIIFormedQueryCondition Struct Reference

Inheritance diagram for IIIFormedQueryCondition:

### Public Member Functions

- **IIIFormedQueryCondition** (const std::string &str)

#### 4.25.1 Detailed Description

Definition at line 51 of file uexception.h.

The documentation for this struct was generated from the following file:

- src/uexception.h

## 4.26 InsertQuery Class Reference

Inheritance diagram for InsertQuery:

### Public Member Functions

- **LEMONDB\_QUERY\_WRITER** (true)
- QueryResult::Ptr **execute** () override
- std::string **toString** () override
- QueryResult::Ptr **combine** (int [taskComplete](#)) override

### Friends

- class **InsertTask**

### Additional Inherited Members

#### 4.26.1 Detailed Description

Definition at line 7 of file `insert_query.h`.

The documentation for this class was generated from the following files:

- `src/query/data/insert_query.h`
- `src/query/data/insert_query.cpp`

## 4.27 InsertTask Class Reference

Inheritance diagram for InsertTask:

## Public Member Functions

- void **execute** () override

## Protected Member Functions

- **LEMONDB\_QUERY\_PTR** ([InsertQuery](#))

## Additional Inherited Members

### 4.27.1 Detailed Description

Definition at line 18 of file insert\_query.h.

The documentation for this class was generated from the following files:

- src/query/data/insert\_query.h
- src/query/data/insert\_query.cpp

## 4.28 Table::IteratorImpl< ObjType, DatumIterator > Class Template Reference

### Public Member Functions

- **IteratorImpl** (DatumIterator datumIt, const [Table](#) \*t)
- **IteratorImpl** (const [IteratorImpl](#) &)=default
- **IteratorImpl** ([IteratorImpl](#) &&) noexcept=default
- [IteratorImpl](#) & **operator=** (const [IteratorImpl](#) &)=default
- [IteratorImpl](#) & **operator=** ([IteratorImpl](#) &&) noexcept=default
- pointer **operator->** ()
- reference **operator\*** ()
- [IteratorImpl](#) & **operator++** ()
- [IteratorImpl](#) & **operator--** ()
- [IteratorImpl](#) **operator++** (int)
- [IteratorImpl](#) **operator--** (int)
- bool **operator==** (const [IteratorImpl](#) &other)
- bool **operator!=** (const [IteratorImpl](#) &other)
- bool **operator<=** (const [IteratorImpl](#) &other)
- bool **operator>=** (const [IteratorImpl](#) &other)
- bool **operator<** (const [IteratorImpl](#) &other)
- bool **operator>** (const [IteratorImpl](#) &other)
- [IteratorImpl](#) **operator+** (int n)
- [IteratorImpl](#) **operator-** (int n)
- [IteratorImpl](#) & **operator+=** (int n)
- [IteratorImpl](#) & **operator-=** (int n)

### Friends

- class **Table**

### 4.28.1 Detailed Description

```
template<typename ObjType, typename DatumIterator>  
class Table::IteratorImpl< ObjType, DatumIterator >
```

Definition at line 183 of file db\_table.h.

The documentation for this class was generated from the following file:

- src/db/db\_table.h

## 4.29 ListTableQuery Class Reference

Inheritance diagram for ListTableQuery:

### Public Member Functions

- QueryResult::Ptr **execute** () override
- std::string **toString** () override

### Additional Inherited Members

### 4.29.1 Detailed Description

Definition at line 7 of file management\_query.h.

The documentation for this class was generated from the following files:

- src/management\_query.h
- src/management\_query.cpp

## 4.30 LoadFromStreamException Struct Reference

Inheritance diagram for LoadFromStreamException:

## Public Member Functions

- **LoadFromStreamException** (const std::string &str)

### 4.30.1 Detailed Description

Definition at line 41 of file uexception.h.

The documentation for this struct was generated from the following file:

- src/uexception.h

## 4.31 LoadTableQuery Class Reference

Inheritance diagram for LoadTableQuery:

## Public Member Functions

- **LEMONDB\_QUERY\_WRITER** (true)
- **LEMONDB\_QUERY\_INSTANT** (true)
- **LoadTableQuery** (std::string table, std::string fileName)
- QueryResult::Ptr **execute** () override
- std::string **toString** () override
- QueryResult::Ptr **combine** (int [taskComplete](#)) override

## Friends

- class **LoadTableTask**

## Additional Inherited Members

### 4.31.1 Detailed Description

Definition at line 11 of file load\_table\_query.h.

The documentation for this class was generated from the following files:

- src/query/management/load\_table\_query.h
- src/query/management/load\_table\_query.cpp

## 4.32 LoadTableTask Class Reference

Inheritance diagram for LoadTableTask:

### Public Member Functions

- void **execute** () override

### Protected Member Functions

- **LEMONDB\_QUERY\_PTR** ([LoadTableQuery](#))

### Additional Inherited Members

#### 4.32.1 Detailed Description

Definition at line 26 of file load\_table\_query.h.

The documentation for this class was generated from the following files:

- src/query/management/load\_table\_query.h
- src/query/management/load\_table\_query.cpp

## 4.33 MaxQuery Class Reference

Inheritance diagram for MaxQuery:

### Public Member Functions

- **LEMONDB\_QUERY\_WRITER** (false)
- `QueryResult::Ptr execute ()` override
- `std::string toString ()` override
- `QueryResult::Ptr combine (int taskComplete)` override

### Protected Member Functions

- **LEMONDB\_TASK\_PTR\_DEF** ([MaxTask](#))

### Friends

- class **MaxTask**

### Additional Inherited Members

#### 4.33.1 Detailed Description

Definition at line 9 of file `max_query.h`.

The documentation for this class was generated from the following files:

- `src/query/data/max_query.h`
- `src/query/data/max_query.cpp`

## 4.34 MaxTask Class Reference

Inheritance diagram for MaxTask:

### Public Member Functions

- void **execute** () override

### Protected Member Functions

- **LEMONDB\_QUERY\_PTR** ([MaxQuery](#))

## Friends

- class **MaxQuery**

## Additional Inherited Members

### 4.34.1 Detailed Description

Definition at line 23 of file max\_query.h.

The documentation for this class was generated from the following files:

- src/query/data/max\_query.h
- src/query/data/max\_query.cpp

## 4.35 MinQuery Class Reference

Inheritance diagram for MinQuery:

## Public Member Functions

- **LEMONDB\_QUERY\_WRITER** (false)
- QueryResult::Ptr **execute** () override
- std::string **toString** () override
- QueryResult::Ptr **combine** (int [taskComplete](#)) override

## Protected Member Functions

- **LEMONDB\_TASK\_PTR\_DEF** ([MinTask](#))

## Friends

- class **MinTask**

## Additional Inherited Members

### 4.35.1 Detailed Description

Definition at line 9 of file min\_query.h.

The documentation for this class was generated from the following files:

- src/query/data/min\_query.h
- src/query/data/min\_query.cpp

## 4.36 MinTask Class Reference

Inheritance diagram for MinTask:

### Public Member Functions

- void **execute** () override

### Protected Member Functions

- **LEMONDB\_QUERY\_PTR** ([MinQuery](#))

### Friends

- class **MinQuery**

## Additional Inherited Members

### 4.36.1 Detailed Description

Definition at line 23 of file min\_query.h.

The documentation for this class was generated from the following files:

- src/query/data/min\_query.h
- src/query/data/min\_query.cpp

## 4.37 MultipleKey Struct Reference

Inheritance diagram for MultipleKey:

### Public Member Functions

- **MultipleKey** (const std::string &str)

### 4.37.1 Detailed Description

Definition at line 31 of file uexception.h.

The documentation for this struct was generated from the following file:

- src/uexception.h

## 4.38 NopQuery Class Reference

Inheritance diagram for NopQuery:

### Public Member Functions

- QueryResult::Ptr **execute** () override
- std::string **toString** () override

### Additional Inherited Members

### 4.38.1 Detailed Description

Definition at line 22 of file query.h.

The documentation for this class was generated from the following file:

- src/query/query.h

## 4.39 NullQueryResult Class Reference

Inheritance diagram for NullQueryResult:

### Public Member Functions

- `std::string toString ()` override

### Additional Inherited Members

#### 4.39.1 Detailed Description

Definition at line 33 of file `query_results.h`.

The documentation for this class was generated from the following file:

- `src/query_results.h`

## 4.40 Table::ObjectImpl< Iterator, VType > Class Template Reference

```
#include <db_table.h>
```

### Public Types

- `typedef std::unique_ptr< ObjectImpl > Ptr`

### Public Member Functions

- `ObjectImpl (Iterator datumIt, const Table *t)`
- `ObjectImpl (const ObjectImpl &)=default`
- `ObjectImpl (ObjectImpl &&) noexcept=default`
- `ObjectImpl & operator= (const ObjectImpl &)=default`
- `ObjectImpl & operator= (ObjectImpl &&) noexcept=default`
- `KeyType key () const`
- `void setKey (KeyType key)`
- `VType & operator[] (const FieldNameType &field) const`
- `VType & operator[] (const FieldIndex &index) const`
- `VType & get (const FieldNameType &field) const`
- `VType & get (const FieldIndex &index) const`

## Friends

- class **Table**

### 4.40.1 Detailed Description

```
template<class Iterator, class VType>
class Table::ObjectImpl< Iterator, VType >
```

A proxy class that provides abstraction on internal Implementation. Allows independent variation on the Representation for a table object

#### Template Parameters

<i>Iterator</i>	
<i>VType</i>	

Definition at line 122 of file db\_table.h.

The documentation for this class was generated from the following file:

- src/db/db\_table.h

## 4.41 PrintTableQuery Class Reference

Inheritance diagram for PrintTableQuery:

### Public Member Functions

- **PrintTableQuery** (std::string table)
- QueryResult::Ptr **execute** () override
- std::string **toString** () override

### Additional Inherited Members

#### 4.41.1 Detailed Description

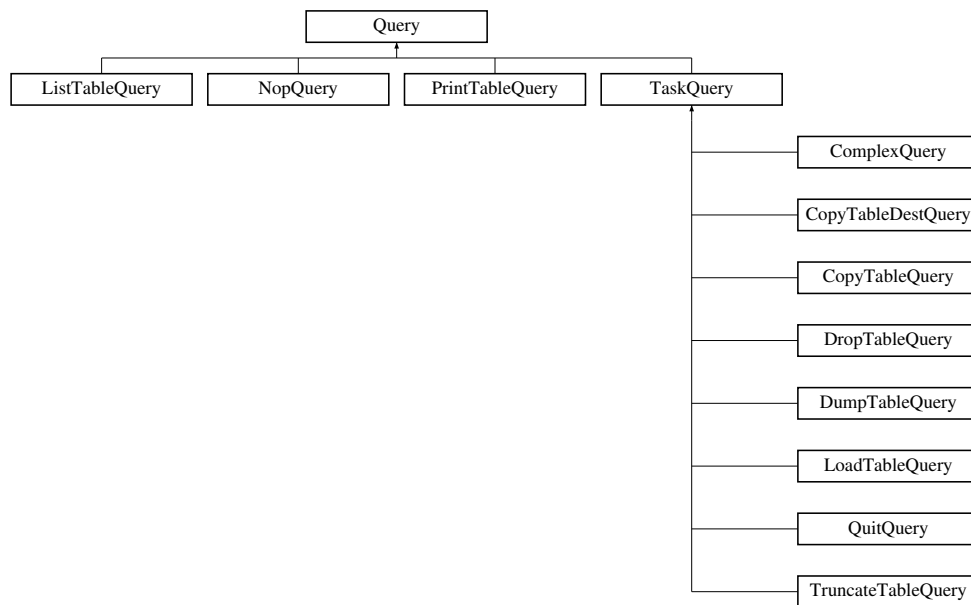

Definition at line 15 of file management\_query.h.

The documentation for this class was generated from the following files:

- src/management\_query.h
- src/management\_query.cpp

## 4.42 Query Class Reference

Inheritance diagram for Query:

### Public Types

- typedef std::unique\_ptr< [Query](#) > **Ptr**

### Public Member Functions

- virtual QueryResult::Ptr **execute** ()=0
- virtual std::string **toString** ()=0
- virtual QueryResult::Ptr **combine** (int taskComplete)
- virtual bool **isWriter** () const =0
- virtual bool **isInstant** () const
- const std::string & **getTableName** ()
- int [getId](#) () const
- int [initId](#) (int id)

### Protected Attributes

- std::string **targetTable**
- int **id** = -1

#### 4.42.1 Detailed Description

Definition at line 23 of file query\_base.h.

## 4.42.2 Member Function Documentation

### 4.42.2.1 getId()

```
int Query::getId ( ) const [inline]
```

get the unique id of this query

#### Returns

Definition at line 46 of file query\_base.h.

### 4.42.2.2 initId()

```
int Query::initId (
    int id ) [inline]
```

will only work when first init the query id

#### Parameters

<i>id</i>	
-----------	--

#### Returns

Definition at line 53 of file query\_base.h.

The documentation for this class was generated from the following file:

- src/query/query\_base.h

## 4.43 QueryBuilder Class Reference

Inheritance diagram for QueryBuilder:

## Public Types

- typedef std::unique\_ptr< [QueryBuilder](#) > **Ptr**

## Public Member Functions

- virtual Query::Ptr **tryExtractQuery** ([TokenizedQueryString](#) &queryString)=0
- virtual void **setNext** (Ptr &&builder)=0
- virtual void **clear** ()=0

### 4.43.1 Detailed Description

Definition at line 15 of file query\_parser.h.

The documentation for this class was generated from the following file:

- src/query\_parser.h

## 4.44 QueryBuilderMatchFailed Class Reference

Inheritance diagram for QueryBuilderMatchFailed:

## Public Member Functions

- **QueryBuilderMatchFailed** (const std::string &qString)

### 4.44.1 Detailed Description

Definition at line 56 of file uexception.h.

The documentation for this class was generated from the following file:

- src/uexception.h

## 4.45 QueryCondition Struct Reference

### Public Attributes

- `std::string` **field**
- `size_t` **fieldId**
- `std::string` **op**
- `std::function< bool(const Table::ValueType &, const Table::ValueType &)>` **comp**
- `std::string` **value**
- `Table::ValueType` **valueParsed**

### 4.45.1 Detailed Description

Definition at line 13 of file `query.h`.

The documentation for this struct was generated from the following file:

- `src/query/query.h`

## 4.46 QueryParser Class Reference

### Public Member Functions

- `Query::Ptr` **parseQuery** (`std::string` queryString)
- `void` **registerQueryBuilder** (`QueryBuilder::Ptr` &&qBuilder)

### 4.46.1 Detailed Description

Definition at line 27 of file `query_parser.h`.

The documentation for this class was generated from the following files:

- `src/query_parser.h`
- `src/query_parser.cpp`

## 4.47 QueryResult Class Reference

Inheritance diagram for `QueryResult`:

## Public Types

- typedef std::unique\_ptr< [QueryResult](#) > **Ptr**

## Public Member Functions

- virtual bool **success** ()=0
- virtual std::string **toString** ()=0

### 4.47.1 Detailed Description

Definition at line 11 of file query\_results.h.

The documentation for this class was generated from the following file:

- src/query\_results.h

## 4.48 QuitQuery Class Reference

Inheritance diagram for QuitQuery:

## Public Member Functions

- QueryResult::Ptr **execute** () override
- std::string **toString** () override

## Additional Inherited Members

### 4.48.1 Detailed Description

Definition at line 10 of file quit\_query.h.

The documentation for this class was generated from the following files:

- src/query/management/quit\_query.h
- src/query/management/quit\_query.cpp

## 4.49 RecordCountResult Class Reference

Inheritance diagram for RecordCountResult:

### Public Member Functions

- **RecordCountResult** (int count)
- std::string **toString** () override

### Additional Inherited Members

#### 4.49.1 Detailed Description

Definition at line 98 of file query\_results.h.

The documentation for this class was generated from the following file:

- src/query\_results.h

## 4.50 SelectQuery Class Reference

Inheritance diagram for SelectQuery:

### Public Member Functions

- **LEMONDB\_QUERY\_WRITER** (false)
- QueryResult::Ptr **execute** () override
- std::string **toString** () override
- QueryResult::Ptr **combine** (int [taskComplete](#)) override

## Protected Member Functions

- `LEMONDB_TASK_PTR_DEF` ([SelectTask](#))

## Friends

- class `SelectTask`

## Additional Inherited Members

### 4.50.1 Detailed Description

Definition at line 13 of file `select_query.h`.

The documentation for this class was generated from the following files:

- `src/query/data/select_query.h`
- `src/query/data/select_query.cpp`

## 4.51 SelectResult Class Reference

Inheritance diagram for `SelectResult`:

## Public Member Functions

- `SelectResult` (`std::vector< std::pair< std::string, std::vector< int > > &&results`)
- `std::string toString` () override

## Additional Inherited Members

### 4.51.1 Detailed Description

Definition at line 124 of file `query_results.h`.

The documentation for this class was generated from the following file:

- `src/query_results.h`

## 4.52 SelectTask Class Reference

Inheritance diagram for SelectTask:

### Public Member Functions

- void **execute** () override

### Protected Member Functions

- **LEMONDB\_QUERY\_PTR** ([SelectQuery](#))

### Friends

- class **SelectQuery**

### Additional Inherited Members

#### 4.52.1 Detailed Description

Definition at line 27 of file `select_query.h`.

The documentation for this class was generated from the following files:

- `src/query/data/select_query.h`
- `src/query/data/select_query.cpp`

## 4.53 SubQuery Class Reference

Inheritance diagram for SubQuery:

### Public Member Functions

- **LEMONDB\_QUERY\_WRITER** (true)
- `QueryResult::Ptr` **execute** () override
- `std::string` **toString** () override
- `QueryResult::Ptr` **combine** (int [taskComplete](#)) override

### Protected Member Functions

- **LEMONDB\_TASK\_PTR\_DEF** ([SubTask](#))

### Friends

- class **SubTask**

### Additional Inherited Members

#### 4.53.1 Detailed Description

Definition at line 9 of file `sub_query.h`.

The documentation for this class was generated from the following files:

- `src/query/data/sub_query.h`
- `src/query/data/sub_query.cpp`

## 4.54 SubTask Class Reference

Inheritance diagram for SubTask:

### Public Member Functions

- void **execute** () override

### Protected Member Functions

- **LEMONDB\_QUERY\_PTR** ([SubQuery](#))

## Friends

- class **SubQuery**

## Additional Inherited Members

### 4.54.1 Detailed Description

Definition at line 23 of file sub\_query.h.

The documentation for this class was generated from the following files:

- src/query/data/sub\_query.h
- src/query/data/sub\_query.cpp

## 4.55 SuccessMsgResult Class Reference

Inheritance diagram for SuccessMsgResult:

## Public Member Functions

- **SuccessMsgResult** (const int number)
- **SuccessMsgResult** (std::vector< int > results)
- **SuccessMsgResult** (const char \*qname)
- **SuccessMsgResult** (const char \*qname, const std::string &msg)
- **SuccessMsgResult** (const char \*qname, const char \*table, const std::string &msg)
- std::string **toString** () override

## Additional Inherited Members

### 4.55.1 Detailed Description

Definition at line 60 of file query\_results.h.

The documentation for this class was generated from the following file:

- src/query\_results.h

## 4.56 SucceededQueryResult Class Reference

Inheritance diagram for SucceededQueryResult:

### Public Member Functions

- bool **success** () override

### Additional Inherited Members

#### 4.56.1 Detailed Description

Definition at line 28 of file query\_results.h.

The documentation for this class was generated from the following file:

- src/query\_results.h

## 4.57 SumQuery Class Reference

Inheritance diagram for SumQuery:

### Public Member Functions

- **LEMONDB\_QUERY\_WRITER** (false)
- QueryResult::Ptr **execute** () override
- std::string **toString** () override
- QueryResult::Ptr **combine** (int [taskComplete](#)) override

### Protected Member Functions

- `LEMONDB_TASK_PTR_DEF` ([SumTask](#))

### Friends

- class `SumTask`

### Additional Inherited Members

#### 4.57.1 Detailed Description

Definition at line 13 of file `sum_query.h`.

The documentation for this class was generated from the following files:

- `src/query/data/sum_query.h`
- `src/query/data/sum_query.cpp`

## 4.58 SumTask Class Reference

Inheritance diagram for `SumTask`:

### Public Member Functions

- void `execute` () override

### Protected Member Functions

- `LEMONDB_QUERY_PTR` ([SumQuery](#))

### Friends

- class `SumQuery`

## Additional Inherited Members

### 4.58.1 Detailed Description

Definition at line 27 of file `sum_query.h`.

The documentation for this class was generated from the following files:

- `src/query/data/sum_query.h`
- `src/query/data/sum_query.cpp`

## 4.59 SwapQuery Class Reference

Inheritance diagram for SwapQuery:

### Public Member Functions

- **LEMONDB\_QUERY\_WRITER** (true)
- `QueryResult::Ptr execute ()` override
- `std::string toString ()` override
- `QueryResult::Ptr combine (int taskComplete)` override

### Friends

- class **SwapTask**

## Additional Inherited Members

### 4.59.1 Detailed Description

Definition at line 12 of file `swap_query.h`.

The documentation for this class was generated from the following files:

- `src/query/data/swap_query.h`
- `src/query/data/swap_query.cpp`

## 4.60 SwapTask Class Reference

Inheritance diagram for SwapTask:

### Public Member Functions

- void **execute** () override

### Protected Member Functions

- **LEMONDB\_QUERY\_PTR** ([SwapQuery](#))

### Friends

- class **SwapQuery**

### Additional Inherited Members

#### 4.60.1 Detailed Description

Definition at line 27 of file swap\_query.h.

The documentation for this class was generated from the following files:

- src/query/data/swap\_query.h
- src/query/data/swap\_query.cpp

## 4.61 Table Class Reference

### Classes

- class [IteratorImpl](#)
- class [ObjectImpl](#)

## Public Types

- typedef std::string **KeyType**
- typedef std::string **FieldNameType**
- typedef size\_t **FieldIndex**
- typedef int **ValueType**
- typedef size\_t **SizeType**
- typedef std::unique\_ptr< **Table** > **Ptr**
- typedef **ObjectImpl**< DataIterator, ValueType > **Object**
- typedef **ObjectImpl**< ConstDataIterator, const ValueType > **ConstObject**
- typedef **IteratorImpl**< **Object**, decltype(data.begin())> **Iterator**
- typedef **IteratorImpl**< **ConstObject**, decltype(data.cbegin())> **ConstIterator**

## Public Member Functions

- **Table** (const std::string &name)
- template<class FieldIDContainer >  
**Table** (const std::string &name, const FieldIDContainer &\_fields)
- template<class FieldIDContainer >  
void **init** (const FieldIDContainer &fields)

- **ConstIterator** **end** () const
- void **addQuery** (**Query** \*query)
- void **completeQuery** ()

## Static Public Attributes

- static constexpr const ValueType **ValueTypeMax** = INT32\_MAX
- static constexpr const ValueType **ValueTypeMin** = INT32\_MIN

## Friends

- `std::ostream & operator<< (std::ostream &os, const Table &table)`

### 4.61.1 Detailed Description

Definition at line 50 of file `db_table.h`.

### 4.61.2 Member Function Documentation

#### 4.61.2.1 `begin()` [1/2]

`Iterator Table::begin ( ) [inline]`

Get a begin iterator similar to the standard iterator

#### Returns

begin iterator

Definition at line 474 of file `db_table.h`.

#### 4.61.2.2 `begin()` [2/2]

`ConstIterator Table::begin ( ) const [inline]`

Get a const begin iterator similar to the standard iterator

#### Returns

const begin iterator

Definition at line 486 of file `db_table.h`.

#### 4.61.2.3 `clear()`

`size_t Table::clear ( ) [inline]`

Clear all content in the table

#### Returns

rows affected

Definition at line 463 of file `db_table.h`.

#### 4.61.2.4 duplicate()

```
bool Table::duplicate (
    Iterator & it ) [inline]
```

Duplicate it and put it into dataNew if {key}\_copy exists, nothing happens this function is used only in duplicate query  
Definition at line 404 of file db\_table.h.

#### 4.61.2.5 empty()

```
bool Table::empty ( ) const [inline]
```

Return whether the table is empty

##### Returns

Definition at line 445 of file db\_table.h.

#### 4.61.2.6 end() [1/2]

```
Iterator Table::end ( ) [inline]
```

Get a end iterator similar to the standard iterator

##### Returns

end iterator

Definition at line 480 of file db\_table.h.

#### 4.61.2.7 end() [2/2]

```
ConstIterator Table::end ( ) const [inline]
```

Get a const end iterator similar to the standard iterator

##### Returns

const end iterator

Definition at line 492 of file db\_table.h.

#### 4.61.2.8 erase()

```
void Table::erase (
    const Iterator & it ) [inline]
```

thread safe function Erase the key in the table Caution: this function only erases the key in keyMap, leaves data unchanged no other operation related to keyMap can be applied before swapData is called

**Parameters**

<i>it</i>	
-----------	--

Definition at line 368 of file db\_table.h.

**4.61.2.9 eraseUnique()**

```
void Table::eraseUnique (
    Object::Ptr && object ) [inline]
```

not thread safe function Remove only one datum only used when delete by key

**Parameters**

<i>it</i>	
-----------	--

Definition at line 355 of file db\_table.h.

**4.61.2.10 field()**

```
const std::vector<FieldNameType>& Table::field ( ) const [inline]
```

Return the fields in the table

**Returns**

Definition at line 457 of file db\_table.h.

**4.61.2.11 mergeData()**

```
void Table::mergeData ( ) [inline]
```

insert dataNew to the end of data then dataNew is cleared for future query this function is used only in duplicate query

Definition at line 421 of file db\_table.h.

**4.61.2.12 move()**

```
void Table::move (
    Iterator & it ) [inline]
```

thread safe function Move datum from data to dataNew Caution: iterator *it* can't be accessed again after [move\(\)](#) is called no other operation related to keyMap can be applied before swapData is called

**Parameters**

<i>it</i>	
-----------	--

Definition at line 381 of file db\_table.h.

**4.61.2.13 name()**

```
const std::string& Table::name ( ) const [inline]
```

Get the name of the table

**Returns**

Definition at line 439 of file db\_table.h.

**4.61.2.14 operator[]()**

```
Object::Ptr Table::operator[] (
    const KeyType & key ) [inline]
```

Access the value according to the key

**Parameters**

<i>key</i>	
------------	--

**Returns**

the Object that KEY = key, or nullptr if key doesn't exist

Definition at line 339 of file db\_table.h.

**4.61.2.15 setName()**

```
void Table::setName (
    std::string name ) [inline]
```

Set the name of the table

**Parameters**

<i>name</i>	
-------------	--

Definition at line 433 of file db\_table.h.

**4.61.2.16 size()**

```
size_t Table::size ( ) const [inline]
```

Return the num of data stored in the table

**Returns**

Definition at line 451 of file db\_table.h.

**4.61.2.17 swapData()**

```
void Table::swapData ( ) [inline]
```

not thread safe function Swap data and newData vector::clear ensures that the capacity of dataNew unchanged so push\_back to dataNew is efficient

Definition at line 394 of file db\_table.h.

**4.61.3 Friends And Related Function Documentation****4.61.3.1 operator<<**

```
std::ostream& operator<< (
    std::ostream & os,
    const Table & table ) [friend]
```

Overload the << operator for complete print of the table

**Parameters**

<i>os</i>	
<i>table</i>	

**Returns**

the origin ostream

Definition at line 94 of file db\_table.cpp.

The documentation for this class was generated from the following files:

- src/db/db\_table.h
- src/db/db\_table.cpp

## 4.62 TableFieldNotFound Struct Reference

Inheritance diagram for TableFieldNotFound:

**Public Member Functions**

- **TableFieldNotFound** (const std::string &str)

### 4.62.1 Detailed Description

Definition at line 36 of file uexception.h.

The documentation for this struct was generated from the following file:

- src/uexception.h

## 4.63 TableNameNotFound Struct Reference

Inheritance diagram for TableNameNotFound:

**Public Member Functions**

- **TableNameNotFound** (const std::string &str)

### 4.63.1 Detailed Description

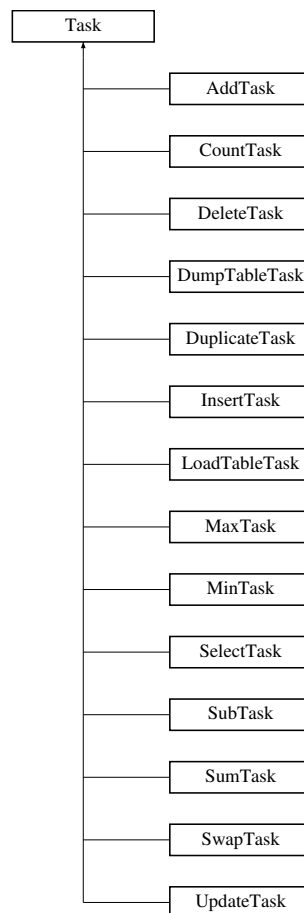

Definition at line 21 of file uexception.h.

The documentation for this struct was generated from the following file:

- src/uexception.h

## 4.64 Task Class Reference

Inheritance diagram for Task:

### Public Types

- typedef std::unique\_ptr< Task > Ptr

### Public Member Functions

- Task (Query \*query, Table \*table=nullptr)
- Task (Query \*query, Table \*table, Table::Iterator begin, Table::Iterator end)
- virtual void execute ()
- Table::SizeType getCounter () const

## Protected Member Functions

- virtual [TaskQuery](#) \* **getQuery** () const

## Protected Attributes

- [Query](#) \* **query**
- [Table](#) \* **table** = nullptr
- [Table::SizeType](#) **counter** = 0
- [Table::Iterator](#) **begin**
- [Table::Iterator](#) **end**
- [QueryResult::Ptr](#) **errorResult** = nullptr

## Friends

- class **Database**

### 4.64.1 Detailed Description

Definition at line 12 of file task.h.

### 4.64.2 Member Data Documentation

#### 4.64.2.1 counter

```
Table::SizeType Task::counter = 0 [protected]
```

Count affected rows in this task

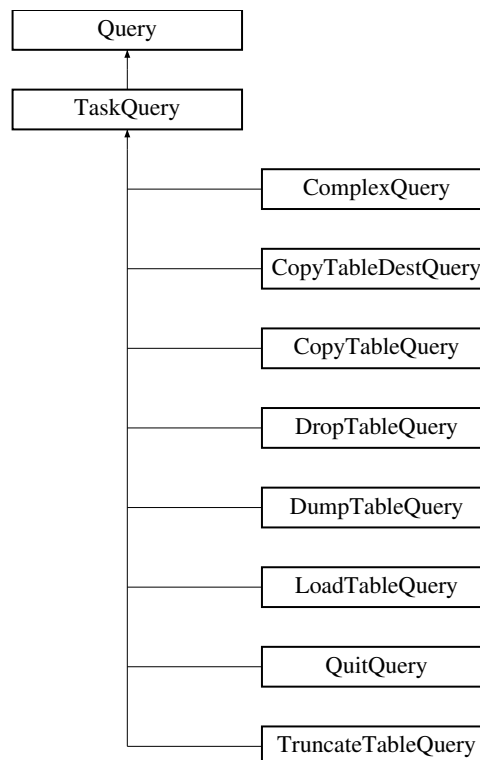

Definition at line 17 of file task.h.

The documentation for this class was generated from the following files:

- src/query/task.h
- src/query/task.cpp

## 4.65 TaskQuery Class Reference

Inheritance diagram for TaskQuery:

### Public Member Functions

- **TaskQuery** (std::string targetTable)
- **Task \* getTask** (size\_t index) const
- **Task \* getTask** (const std::vector< std::unique\_ptr< Task > >::iterator &it) const
- void **start** ()
- void **complete** ()
- void **complete** (QueryResult::Ptr &&result)
- template<class TaskType >  
void **addIterationTask** (Database &db, Table &table)
- template<class TaskType >  
void **addUniqueTask** (Database &db, Table \*table=nullptr)

### Protected Attributes

- size\_t **tasksSize** = 1
- int **taskComplete** = 0
- std::vector< std::unique\_ptr< Task > > **tasks**
- std::mutex **tasksMutex**

### Additional Inherited Members

#### 4.65.1 Detailed Description

Definition at line 33 of file query.h.

## 4.65.2 Member Function Documentation

### 4.65.2.1 addIterationTask()

```
template<class TaskType >
void TaskQuery::addIterationTask (
    Database & db,
    Table & table ) [inline]
```

For iteration query, we can split them in this function

Definition at line 59 of file query.h.

### 4.65.2.2 addUniqueTask()

```
template<class TaskType >
void TaskQuery::addUniqueTask (
    Database & db,
    Table * table = nullptr ) [inline]
```

For non-iteration query that should be done later

Definition at line 92 of file query.h.

### 4.65.2.3 complete() [1/2]

```
void TaskQuery::complete ( )
```

Complete a task add the complete query to the result vector here should add a unique id for each query - ok should add a function to print results in correct order

Definition at line 12 of file query.cpp.

### 4.65.2.4 complete() [2/2]

```
void TaskQuery::complete (
    QueryResult::Ptr && result )
```

Complete a query

Definition at line 26 of file query.cpp.

#### 4.65.2.5 start()

```
void TaskQuery::start ( )
```

Debug function for starting a query

Definition at line 8 of file query.cpp.

### 4.65.3 Member Data Documentation

#### 4.65.3.1 taskComplete

```
int TaskQuery::taskComplete = 0 [protected]
```

Count the completed tasks, locked by tasksMutex

Definition at line 38 of file query.h.

#### 4.65.3.2 tasks

```
std::vector<std::unique_ptr<Task> > TaskQuery::tasks [protected]
```

The unique\_ptr of tasks are stored here

Definition at line 40 of file query.h.

#### 4.65.3.3 tasksMutex

```
std::mutex TaskQuery::tasksMutex [protected]
```

protect taskComplete and tasks

Definition at line 42 of file query.h.

#### 4.65.3.4 tasksSize

```
size_t TaskQuery::tasksSize = 1 [protected]
```

The size of tasks, defined to avoid locking

Definition at line 36 of file query.h.

The documentation for this class was generated from the following files:

- src/query/query.h
- src/query/query.cpp

## 4.66 TokenizedQueryString Struct Reference

### Public Attributes

- `std::vector< std::string >` **token**
- `std::string` **rawQueryString**

### 4.66.1 Detailed Description

Definition at line 9 of file `query_parser.h`.

The documentation for this struct was generated from the following file:

- `src/query_parser.h`

## 4.67 TruncateTableQuery Class Reference

Inheritance diagram for TruncateTableQuery:

### Public Member Functions

- `QueryResult::Ptr` **execute** () override
- `std::string` **toString** () override

### Additional Inherited Members

### 4.67.1 Detailed Description

Definition at line 11 of file `truncate_query.h`.

The documentation for this class was generated from the following files:

- `src/query/management/truncate_query.h`
- `src/query/management/truncate_query.cpp`

## 4.68 UnableToOpenFile Struct Reference

Inheritance diagram for UnableToOpenFile:

### Public Member Functions

- **UnableToOpenFile** (const std::string &file)

### 4.68.1 Detailed Description

Definition at line 9 of file uexception.h.

The documentation for this struct was generated from the following file:

- src/uexception.h

## 4.69 UpdateQuery Class Reference

Inheritance diagram for UpdateQuery:

### Public Member Functions

- **LEMONDB\_QUERY\_WRITER** (true)
- QueryResult::Ptr **execute** () override
- std::string **toString** () override
- QueryResult::Ptr **combine** (int [taskComplete](#)) override

### Friends

- class **UpdateTask**

## Additional Inherited Members

### 4.69.1 Detailed Description

Definition at line 7 of file `update_query.h`.

The documentation for this class was generated from the following files:

- `src/query/data/update_query.h`
- `src/query/data/update_query.cpp`

## 4.70 UpdateTask Class Reference

Inheritance diagram for UpdateTask:

### Public Member Functions

- void **execute** () override

### Protected Member Functions

- **LEMONDB\_QUERY\_PTR** ([UpdateQuery](#))

### Friends

- class **ComplexQuery**

## Additional Inherited Members

### 4.70.1 Detailed Description

Definition at line 24 of file `update_query.h`.

The documentation for this class was generated from the following files:

- `src/query/data/update_query.h`
- `src/query/data/update_query.cpp`
